Authorization for this examiner's amendment was given in a telephone interview with Juan Carlos Marquez on 1-20-2004.

The application has been amended as follows: Claims 2 and 9-12 were amended.

2. (Twice amended) An electrophoresis chip comprising:

an electrical insulating substrate having a linear hydrophilic region in a longitudinal direction and a hydrophobic region adjacent to said hydrophilic region on a surface of said substrate;

an electrophoresis medium, formed on said hydrophilic region of said substrate and having a gap in the medium in the longitudinal direction; and

a pair of electrodes connected to both ends of said electrophoresis medium in said longitudinal direction

9. (Twice amended) An electrophoresis chip, comprising:

an electrical insulating substrate, and

an electrophoresis medium, formed to be linear in a longitudinal direction on a surface of said substrate and having a gap in the medium in the longitudinal direction,

wherein a region adjacent to said electrophoresis medium on said surface of said substrate is hydrophobic; and

a length of said gap in said longitudinal direction of said electrophoresis medium is set in a range of 0.2 mm to 1 mm.

10. (Twice amended) An electrophoresis chip comprising:

an electrical insulating substrate having a plurality of linear hydrophilic regions formed substantially parallel on a surface and a hydrophobic region adjacent to said hydrophilic regions;

a plurality of electrophoresis media, each formed on one of said plurality of hydrophilic regions of said substrate and having a gap in each electrophoretic media; and

a pair of electrodes, one being connected to one end of each said plurality of electrophoresis media and the other being connected to the other end of each thereof.

11. (Twice amended) An electrophoresis chip comprising:

an electrical insulating substrate having a plurality of linear hydrophilic regions formed substantially parallel on a surface of said substrate and a hydrophobic region adjacent to said hydrophilic regions;

a plurality of electrophoresis media, each formed on one of said hydrophilic regions of said substrate and having a gap in each of said electrophoretic media; and

plural pairs of electrodes individually connected to both ends of each of said plurality of electrophoresis media.

12. (Twice amended) An electrophoresis chip comprising:

an electrical insulating substrate having a thin and long hydrophilic region formed in a longitudinal direction on a surface of said substrate and a hydrophobic region formed surrounding said hydrophilic region; and

an electrophoresis medium, formed on said hydrophilic region of said substrate and having a gap in the medium in the longitudinal direction,

wherein an electrophoresis lane is formed by said electrophoresis medium and sample solution supplied to said gap.
